Inflammatory arthritis (IA) is a debilitating joint disorder that can cause pain, stiffness and joint destruction in patients. IA disproportionately affects 2.5 times more females than males often striking during childbearing years. As the Internet is increasingly used by patients with chronic conditions to seek and share information, our objective was to conduct a qualitative descriptive study of posts on the social news website, Reddit, to understand the information needs of women with arthritis regarding pregnancy and parenting. We searched posts, namely questions and responses, on three subreddit sites r/Thritis, r/Rheumatoid, and r/BabyBumps over a 10-year period. All posts were reviewed and those that specifically mentioned having arthritis and family planning, pregnancy, and/or parenting/having children were included. We applied qualitative content analysis involving steps of line-by-line coding, constant comparison, and clustering of codes into subcategories, categories, and final themes. We identified 87 posts and included 59 posts for qualitative analysis. We identified 5 themes and corresponding categories: 1) perinatal disease management; 2) empowerment and social support; 3) impact of arthritis on pregnancy and parenting; 4) attitude towards having children; and 5) pregnancy information and resources for arthritis. Qualitative analysis of publicly available posts about arthritis, pregnancy and parenting shows that women with arthritis sought information about disease management before, during, and after pregnancy as well as the impacts of arthritis while being pregnant or when parenting. Altogether, findings speak to the importance of supporting the information and support needs of women with arthritis who are considering or planning pregnancy.
